

RaashanHouse - Voice Shopping Assistant

Brief Approach

Repo github.com/tanishhkh/voice-command-mart

Live raashan-house.vercel.app

Tanishk Jain

Talk. Add. Done.

RaashanHouse turns speech into a shopping list. Tap the mic and say "add milk" or "I need two bottles of water", the item lands on your list instantly, sorted into its right category with the right quantity.

An NLP Engine That Actually Listens

It understands how people really talk, not fixed commands. "I want to buy apples", "get me some bananas", and "add apples" all map to the same action. It also catches quantity, brand, and price, so "find toothpaste under 5 dollars" and "remove milk from my list" both just work. It speaks your language too, multiple languages are supported.

Never An Empty Screen

A fresh list opens with a friendly prompt instead of a blank page. While you shop, the app quietly suggests staples, seasonal picks, and smart substitutes, so there is always something useful to look at.

Built To Feel Premium

The interface is styled like a real grocery shelf, clean, colorful, and premium, not a plain form. It is wired to work equally well on desktop and mobile, so the experience holds up at home or on the go.
